

## Pro-Matrix Curve

This was a heavily broken down tooth that required a large restoration (1)

(1)

The plan was to build a core and consider a crown in future if the tooth remains asymptomatic.

Due to the extensive loss of tooth tissue we required a circumferential band. I used a Pro-Matrix Curve (narrow).

(2)

Pro –Matrix Curve was used over the rubber dam clamp (2). This is often not possible with other matrix systems.

(3)

I was able to produce a reasonable restoration (3 & 4) and the patient was delighted with the outcome. I plan to place a crown in future.
